Experiment - 5

Name: Aditya Chandra
UID: 23BCS12981
Branch: BE-CSE
Section/Group: KRG_3B
Semester: 5th
Date of Performance: 19/9/25
Subject Name: Advanced Database and Management System
Subject Code: 23CSP-333

Aim:

Medium-Problem Title: Generate 1 million records per ID in 'transaction_data' using generate_series() and random() ,create a normal view and a materialized view 'sales_summary' with aggregated metrics (total_quantity_sold , total_sales, total_orders) , and compare their performance and execution time.

Procedure (Step-by-Step):

1. Create a large dataset:
   - Create a table names transaction_data (id , value) with 1 million records.
   - take id 1 and 2, and for each id, generate 1 million records in value column
   - Use Generate_series () and random() to populate the data.
2. Create a normal view and materialized view to for sales_summary, which includes total_quantity_sold, total_sales, and total_orders with aggregation.
3. Compare the performance and execution time of both.

Sample Output Description:

The transaction_data table has 2 million rows (1 million per ID) with random values. The normal view sales_summary computes aggregates on the fly, while the materialized view sales_summary_mv stores precomputed results. Queries on the materialized view are much faster, but it needs refreshing when data changes, whereas the normal view always shows upto-date results.

Source Code

```
Create table TRANSACTION_DATA(id int,val decimal);
INSERT INTO TRANSACTION_DATA(ID,VAL) SELECT
1,RANDOM()
```

```
FROM GENERATE_SERIES(1,1000000);

INSERT INTO TRANSACTION_DATA(ID,VAL) SELECT
2,RANDOM()
FROM GENERATE_SERIES(1,1000000);

SELECT * FROM TRANSACTION_DATA;

CREATE or REPLACE VIEW SALES_SUMMARY AS
SELECT
ID,
COUNT(*)    AS    total_quantity_sold,
sum(val) AS total_sales, count(distinct
id) AS total_orders FROM
TRANSACTION_DATA GROUP BY
ID;

EXPLAIN ANALYZE
SELECT * FROM SALES_SUMMARY;
CREATE MATERIALIZED VIEW SALES_SUMM AS
SELECT
ID,
COUNT(*) AS total_quantity_sold, sum(val) AS total_sales, count(distinct id) AS total_orders FROM
TRANSACTION_DATA GROUP BY ID;

EXPLAIN ANALYZE
SELECT * FROM SALES_SUMM;
```

Hard-Problem Title: Create restricted views in the sales database to provide summarized, non-sensitive data to the reporting team, and control access using DCL commands(GRANT and REVOKE).

Procedure (Step-by-Step):

1. Create restricted views-
   Define views that show only **aggregated sales data** (e.g., total_sales, total_orders) without exposing sensitive columns like customer details or payment info.
2. Assign access to reporting team(or client)-
   Use "GRANT SELECT ON view_name TO reporting_user; " to give access.
   Revoke access if needed.
   Use "REVOKE SELECT ON view_name FROM reporting_user;" to remove access.
   Verify access
   Reporting users can query the view but cannot access base tables directly, ensuring security

Sample Output Description:

The result shows the restricted view providing summarized sales data only like
- Columns shown are - product_id,total_quantity_sold, total_sales, total_orders
- Columns hidden are - Customer names, addresses, payment details

A reporting user querying the view sees something like :
- Product 101 - 5000 units sold, total sales Rs. 12,50,000,500 orders.
- Product 102 - 3200 units sold, total sales Rs. 8,60,000,320 orders.

Assign access to reporting team(or client)-

-Use "GRANT SELECT ON view_name TO reporting_user; " to give access.

2. Revoke access if needed.
   -Use "REVOKE SELECT ON view_name FROM reporting_user;" to remove access.
3. Verify access

- Reporting users can query the view but cannot access base tables directly, ensuring security.

Sample Output Description:

The result shows the restricted view providing summarized sales data only like

- Columns shown are - product_id,total_quantity_sold, total_sales, total_orders - Columns hidden are - Customer names, addresses, payment details

A reporting user querying the view sees something like :
- Product 101 - 5000 units sold, total sales Rs. 12,50,000,500 orders.
- Product 102 - 3200 units sold, total sales Rs. 8,60,000,320 orders.
When the user tries to query the base "sales_transactions" table directly, access is denied, enforcing security.

2. Objective: To design and implement secure, efficient data access mechanisms by creating large-scale transaction datasets, summarizing them through normal and materialized views for performance comparison, and enforcing restricted access to sensitive data using views and DCL commands.

Source Code

```
CREATE TABLE customer_data ( transaction_id
  SERIAL PRIMARY KEY, customer_name
  VARCHAR(100), email VARCHAR(100), phone
  VARCHAR(15), payment_info VARCHAR(50), -
  - sensitive order_value DECIMAL, order_date
  DATE DEFAULT CURRENT_DATE
);

-- Insert sample data
INSERT INTO customer_data (customer_name, email, phone, payment_info, order_value)
VALUES
('Mandeep Kaur', 'mandeep@example.com', '9040122324', '1234-5678-9012-3456', 500),
